
Monitored application (Spring Boot on Kubernetes)
auth-service
payment-service
ledger-service
notification-service
metrics, health, fault status
Telemetry collector + synthetic login-and-payment probe
Orchestration: LangGraph state graph (Fig. 2)
detect → diagnose → propose → validate → approve → execute → verify
root cause decided by signature matching; LLM narrates only
approved action only
interrupt / resume
Isolation Forest
one per service
Retrieval memory
ChromaDB, Memory set
Local LLM
Ollama, narration
system boundary
Human operator (approve / reject)
